

How to... fit alloy pedals

A modified car without alloy pedal extensions is like Revs' Jo going clubbing wearing a big thermal pants and a baggy jumper - not what you want to see. Fortunately for all of us, Jo's never seen wearing more than the bare minimum, and fitting a set of alloy pedal extensions to your motor is as easy as downing a bottle of Smirnoff Ice.

We've fitted a set of Sparco's finest in plain alloy as they look ultra-trick and come with the necessary rubber grips to make them legal. Well sorted!

THE LOWDOWN

Time: 1-2 hours
Skills: piece of piss, mate
Cost: £17.99
Tools: Spanner (10mm), allen keys, marker pen, pair of pliers, drill and bits

1
 Rip the packet open and when all the rubber grips fall on the floor, pick them up. Push the rubber grips through the holes in the pedals

2
 Before you start drilling holes everywhere, roughly position your funky new pedals over the car's originals. They must be a minimum of 50mm apart

3
 Get yourself a falt pen and mark through the fixing holes onto the original pedals. This is so you'll know where to drill

4
 Check that when you drill through the original pedal you're not drilling into its arm. Drilling's easier if you support the pedal with some wood

5
 When you opened the packet, you'll also have dropped the fixing bolts. Find'em, then using an allen key and a spanner, bolt the first pedal in place

6
 If your pedal extensions are too close, it could be dangerous, so double check that they're 50mm apart before the final fitting

7
 In the time it takes your bird to wash her hair you'll have the job done. Not only is the result trick looking, driving with them is mucho more fun

THE LAW SAYS...

Two things you've got to watch for - and so long as you follow our advice, you'll be sorted. Only kits including brake and clutch pedals with rubber grips are road legal. When fitted, the pedals must be far enough apart so you can operate them properly - 50mm should do.
